A. Current State

 01	Top cover should not be installed if rack mounted
 02	Bottom cover should not be installed if rack mounted
 03	RF deck cover should be installed
 04	Factory holes in left side to allow adjustment of mechanical filters
 05	A Check the VFO position you may not want to loosen some screws
 05	B Collins / Motorola VFO
 05	C Cosmos VFO
 06	IF output connector on back panel is present
 07	IF output cable is present
 08	All the knobs are present
 09	Any obvious broken parts
 10	Any missing parts
 11	Any leaking parts
 12	Any wire harness damage

B. Modifications Installed

 01	Diode load hole in the front panel (not desired)
 02	Adjustment hole in the top dust cover for the meter adjustment.
 03	Micro dial on BFO
 04	Jumper from break-in on terminal board to ground
 05	A IF deck has no adjustments for mechanical filters
	B IF deck has trimmers only on top for mechanical filters
	C Chassis has no holes for under deck trimmer caps
	D Chassis has four added holes for under deck trimmer caps
	E Chassis has four manufactured holes for under deck trimmer caps
	A Ballast tube is original 3TF7
 06	B Ballast tube is 12 volt filament tube (12BY7 12.6 V .3 A)
 06	C Ballast tube is diode
 06	D Ballast tube is resistor
	E Ballast tube is removed with 12BA6 in BFO and VFO
	F Ballast tube is removed with 6.3 volt filaments for BFO and VFO
	A Solid state 26Z5's sockets unwired
	B Solid state 26Z5's sockets crimped over
	C Solid state 26Z5's diodes on top of sockets
	D Solid state 26Z5's no clue provided
	Spook cover on dial bezel
	Colored dial lights (red or blue)
 10	LED dial lamps
 11	EIA tube shields
	The selenium rectifier is replaced with bridge rectifier
	Replaced power filter caps
	Replaced AGC time constant caps
	Langford AGC diode modifications
	Other SSB modifications
	A Line filter is still original
	B Line filter is GFI friendly
	C Line filter is missing
	R390A has a quality capacitor for C553
	R390A black or brown beauties have been replaced in IF and RF
	A R390A power supply filter caps original style
	B R390A power supply filter caps re-stuffed cans
	C R390A power supply filter caps re-stuffed other package
	D R390A power supply filter caps under deck
	A R390 power supply filter caps original style
	B R390 power supply filter caps re-stuffed cans
	C R390 power supply filter caps re-stuffed other package
	D R390 power supply filter caps replaced other
	A R390 Audio 1UF B+ filter caps original style
	B R390 Audio 1UF B+ filter caps re-stuffed
	C R390 Audio 1UF B+ filter caps replaced under deck
	Paper caps removed from Audio module.
	R390A C604 0.01 300 WVDC 20% paper replaced with .022 400 V
	R390A C605 0.01 300 WVDC 20% paper replaced with .022 400 V
	R390A C609 8uf 30 WVDC Tantalum Electrolytic replaced
 21	R390A 6626 MIL spec replacing the 0A2 commercial tube

28 R390A R504 should have a value of 9 29 A Line meter is original type 29 B Line meter is correct resistance 29 C Line meter is modified circuit as 29 D Line meter does not have correct 30 A Carrier meter is original type 30 B Carrier meter is correct resistance 30 C Carrier meter is modified circuit 30 D Carrier meter does not have correct	but re faced and meter face ace but re faced and meter
C. Cosmetic Clean Up	
O1 Remove all of the knobs and lightly O2 Pull all of the modules out of rece O3 Drop the front panel O4 Rip it's gizzard out and scatter an O5 Try but manage to not loose any of O6 Do not have any extra parts left or O7 Pull all the tube shields O8 Pull all the tubes O9 Remove the RF slug racks and spring O1 Wipe each of the RF cores out with O1 Wipe the slugs off, and eye ball the O2 Rayon All of the RF slugs are all O3 Rayon All of the Variable six IF si O4 Rayon RF slugs type b O5 Try but manage to not loose any of O6 Do not have any extra parts left or O7 Pull all the tubes O9 Remove the RF slug racks and spring O9 Remove the RF slugs are all	eiver nd toss the parts around the parts ver when finished gs a damp Q-tips nem the same
<pre> 17 R390 Second IF slugs 18 Remove the RF coil can assemblies</pre>	
19 Straighten the IF and RF can asseml 20 Verify that the index washers were 21 Give the chassis a bath with soap a 22 Wash the front panel with soap and	installed in the two big knobs and water let dry water let dry
23 Wash the modules with soap and wate 24 Do not take apart the 6 camshafts a	
25 Do not clake apart the 6 camsharts of the community of the antenna trimmer insupplied to 26 Do not saturate / soak / submerge 27 Clean the slug rack rollers by worless Keep lubing and wiping them until community 29 Deoxit the tube sockets and coil so 30 Deoxit the RF band switch	ulating fiber washers the slugs king penetrating oil into rollers only clean oil comes out
31 Give rest of RF deck a bath (hard of	core or cosmetic)

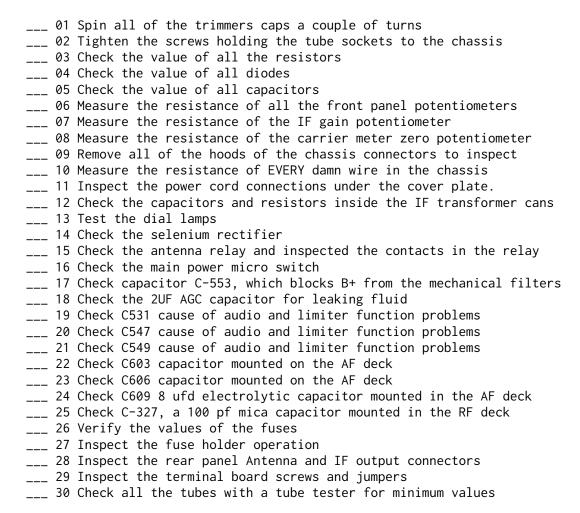

D. Hard Core RF Module Cleaning

 01	Disassemble the gear train
 02	When you take the split gears apart, tie them together
 03	Maintain the orientation that they were originally assembled with
 04	Except for the counter toss all of the parts in a coffee can
 05	Add favorite degreaser and let brew
 06	Work penetrating oil into the bearings of the camshafts
 07	Keep lubing and wiping them until only clean oil comes out
 08	Now bath the RF deck in soap and water (dish washer)
 09	Now bath the Gear parts in soap and water (dish washer)
 10	Dry the RF deck and gears (all day in the sun light)
 11	Use 10W30 Mobil 1 synthetic oil for the RF deck
	Use Pennzoil wheel bearing grease on the detent
	Use compressed air to work oil into the bearings of the camshafts
 14	Lubricate each part of gear train prior to assembly
 15	Reassemble the Gear Train
 16	Use compressed air to work oil into the gears
	Wipe out excess oil
 18	Conduct mechanical alignment of the Gear Train
 19	Deoxit all the tube socket pins
	Deoxit all the connector sockets
 21	Deoxit all the plug pins

E. Cosmetic RF Module Cleaning

 01	Hang Gear Train over edge of bench
 02	Rotate the deck any way needed to work out dirt
 03	Use liberal amounts of cleaner to wash gears
 04	Use compressed air to push cleaner into parts and dirt out
	Use penetrating oil on first pass
 06	Use Alcohol on second pass
 07	Use degreaser on third pass
 80	Use simple soap on fourth pass
	Dry the RF deck and gears (all day in the sun light)
 10	Use 10W30 Mobil 1 synthetic oil for the RF deck
 11	Use Pennzoil wheel bearing grease on the detent
 12	Use compressed air to work oil into the bearings of the camshafts
 13	Use compressed air to work oil into the gears
 14	Wipe out excess oil
 15	Conduct mechanical alignment of the Gear Train
	Deoxit all the tube socket pins
	Deoxit all the connector sockets
 18	Deoxit all the plug pins

F. Rebuild Inspection / Visual Inspection

G. Reassemble The Receiver

 01	Inspect the cams for burrs where the rollers ride on, hone if needed
 02	Inspect the gear clamps for cracks replace as needed
 03	Inspect the spline bolts in the gear clamps replace as needed
 04	Inspect the roller retainers on the slug racks these must roll freely
 05	Inspect slug racks for square true operation fix as needed
	Inspect slug racks for burrs and gouges on the end surfaces and fix
	Replace the RF deck transformer cans
	Replace the slug racks inspect for proper installation of racks
	Install the slug rack springs
	Install the calibration crystal oven
11	Inspect the slug rack springs for poor tension replace as needed
12	"Time" the RF deck band switch
13	"Time" the OSC deck band switch
	Install OSC deck subassembly
	Check the alignment and operation of the OSC deck switch
	In R390 check the Oldham coupler between OSC and RF decks
	In R390 check the OSC deck switch "timing"
	Install RF subassembly deck
	In R390 install the calibration sub assembly deck
	Install VFO subassembly
	Check the VFO shaft alignment to the KHz shaft adjust as needed
	Check the VFO Oldham coupler spacing
24	Install the VFO Oldham coupler spring
	Reinstall the front panel
 25	Conduct power supply module: visual inspection
	Verify power supply 115 volt switch setting
 27	Inspect the solder connections in power supply (diodes added)
	Install the power supply module
 29	Install the IF module
 20	Install the Audio module
	Lightly lube the set screws in the knobs and install the knobs
	Lightly lube the shafts of each front panel switches
	Lightly lube the shafts of each front panel potentiometers
	Lightly lube the shafts IF gain potentiometer
 35	Lightly lube the shafts carrier meter adjust potentiometer
 36	IF deck lightly lube the shaft extensions bushings
 37	Reinstall the knobs
 38	Check the tightness on all of the screws and clamps
 39	Install the tubes
	Install selected tube shields
	All the knobs must operate freely
	Knobs must not be loose on shafts
	Verify all connectors are properly seated
	Ensure the wire harness is tucked in on the bottom side

H. Mechanical Alignment

 01	Set Oven switch to OFF
 02	Loosen the dial lock, check the knob and lock operation
	Check the zero adjust knob adjustment operation
	Set the zero adjust to center
	Check the over run and under run on the KHz knob (10 turn stop)
 05	Adjust the KHz counter as needed (greater than 25 -963 , -972)
 06	Check the over run and under run on the MHz knob (10 turn stop)
	Adjust the MHz counter as needed
	Set the R390A to 7+000 Set the R390 to 2.000
 09	Check the cam alignment starting with the 8-16 MHz Cam
	A If the 8-16 MHz Cam need adjusting then loosen the following
 10	B Release the clamp for 2-4 the slug rack should fall
 10	C Release the clamp for 4-8 the slug rack should fall
 10	D Release the clamp for 16-32 the slug rack should fall
 10	E The 8-16 slug rack should also fall
 11	Hold the 8-16 and 16-32 cam in place
 12	Tighten the 16-32 MHz Cam clamp
 13	Hold the 4-8 cam in place
 14	Tighten the 4-8 MHz Cam clamp
 15	Hold the 2-4 cam in place
 16	Tighten the 2-4 MHz Cam clamp
 17	Adjust the 1-2 MHz Cam if needed
 18	Adjust the .5-1 MHz Cam if needed
	Adjust the 1 st Variable IF Cam if needed
	Adjust the 2 nd Variable IF Cam if needed
 21	Adjust the VFO if needed

I. Knobology Dynamic Testing Monthly Test

 01	Set the Function Switch to MGC
 02	Eye ball the receiver in the dark for blue tube glow
 03	Eye ball the dial lights
	Get the head phones adjusted over the ears
	Set the Line Meter to 0
	Set the Line gain to 10
	Set the ANT Trim to 0
	Set the AGC to MED
 aa	Set the LIMITER to OFF
	Set the Band Width to 2KHz
 11	Set the BFO Pitch to 0
 12	Set the BFO OFF
	Set the Breakin OFF
	Set the Audio Response to wide
	Set the Zero Adjust to center and confirm knob is not loose
	Release the Dial Lock and confirm knob is not loose
	Set the Local Audio to max and confirm knob is not loose
	Set the RF to max and confirm knob is not loose
	Run the Local Audio from end to end and confirm knob is not loose
 20	Listen for pot pop in the head phones
	Confirm Local Audio pot V603, V602A are good
 22	Switch the band pass filter from wide to sharp to wide
 23	Confirm band pass filter knob is not loose
 24	Listen for switch pop in the head phones
 25	Listen for narrow audio responce in the head phones
 26	Confirm Filter, switch, V601A are good
 27	Set the LIMITER to ON
 28	Listen for switch pop in the head phones
	Run the LIMITER pot from end to end
 30	Listen for a change in Audio spectrum
	Set the LIMITER to OFF and confirm knob is not loose
	Confirm Limiter switch, V507 are good
 33	Set the Function to CAL
 34	Listen for the Antenna Relay to click between MGC and CAL
	Set the BFO ON and confirm knob is not loose
	Set the Khz to 500Khz
	Vary the BFO Pitch and confirm knob is not loose
 38	Confirm the BFO pitch goes through zero and the knob stops work
 39	Set the Band Width to .1Khz, 1Khz, 2KHz, 4Khz, 8Khz, 16Khz
	Listen for a change in Audio spectrum and confirm knob is not loose
 41	Set the Band Width to .1Khz
 42	Set the BFO Pitch to zero, confirm knob adjustment for zero is good
	Vary the Khz Knob to get a zero BFO through the .1KHz
	Confirm V505, V701, V506B, V504, V503, V502, V501 are good
	Set the Band Width to 4Khz
	Set the MHz to 00
	Verify Mhz stop at 00
	Set the Khz to 500Khz and listen for a cal tone
	Move the Mhz knob up one detent

	Verify detent seats, verify band switch changes as needed
 51	Verify 2 nd Crystal Oscillator crystal is within 1KHz on each Mhz
 52	Move the Mhz knob up one detent
 53	Verify Mhz stop at 31
 54	Dial Khz to 000
 55	Check counter under run
 56	Dial Khz to 000 and null cal tone to zero with BFO
 57	Dial Khz to each 100 KHz and note VFO spread
 58	Dial Khz to 900 and note that total VFO spread is less than 300 Hz
 59	Check counter over run
 60	Ground break in and set break in ON
 61	Confirm audio mutes
 62	Set break in OFF
	Confirm antenna relay operation in STANDBY and CAL
 64	Set the Function to AGC
	Set the AGC to SLOW, MED, FAST
	Observe that the carrier meter moves upscale and drops back to zero
	Set the Function to CAL
	Set the BFO ON
	Dial KHz to a cal tone and adjust BFO for a tone
	Set the line gain to max
	Set the line meter switch to 0
	Set the line gain for a meter indication of 0
	Set the line meter switch to +10
	Observe the line meter reads -10
	CARRIER LEVEL meter deflection of at least 40 dB on Cal tone
	Set the Function to AGC
	Tune KILOCYCLE CHANGE control across any band
	Tune KILOCYCLE CHANGE control through several signals
	Output volume should be nearly constant
	Tune KILOCYCLE CHANGE control to one signal
	CARRIER LEVEL meter indicates strength of received signals
	Rotate ANT TRIM control to peak CARRIER LEVEL meter
	Set FUNCTION switch to MGC
	Tune the receiver away from any signal
 85	CARRIER LEVEL should not indicate (read zero)

J Adjust the IF gain R519

```
___ 01 Set the Line Meter OFF
___ 02 Set the Line gain to 0
___ 03 Set the ANT Trim to 0
___ 04 Set the AGC to MED
___ 05 Set the LIMITER to OFF
___ 06 Set the Band Width to 2KHz
___ 07 Set the BFO Pitch to 0
___ 08 Set the Audio Response to WIDE
___ 09 Set the Breakin OFF
___ 10 Set the Function to MGC
___ 11 Set the BFO to OFF
___ 12 Release the Zero Adjust
___ 13 Release the Dial Lock
___ 14 Set the Local Audio to max
___ 15 Set the RF to max
___ 16 Remove P114 from J514
___ 17 Remove P213 from J513
___ 18 Remove P218 from J518
___ 19 Remove J116 adapter from the back panel if necessary
___ 20 Couple P114 to J513
___ 21 Couple P116 to J116
___ 22 Couple J116 to the signal generator RF output
___ 22 Adjust signal generator for 455 KHz output frequency
___ 24 Adjust signal generator for 150 micro volt RF output
___ 25 Adjust signal generator for 30 % audio tone modulation (400 Hz)
___ 26 Meter diode load output for -7 volts DC
___ 27 Place a 600 ohm load across the local audio output
___ 28 Place a 600 ohm load across the line audio output
___ 29 Meter local audio output for 450 milliwatts, 27 db, or 17.3 Volts AC
___ 30 Adjust the IF gain R519 for -7 V DC on the diode load
___ 31 Observe the local audio output level is greater than 400 milliwatts
___ 32 Local Audio should be 17.3 Volts AC across 600 Ohms 450 mw
___ 33 Line Audio should be 2.45 Volts AC across 600 Ohms 10 mw
___ 34 Phone Audio should be .78 Volts AC across 600 Ohms 1 mw
___ 35 Line Audio at .78 Volts across 600 should be Line Meter Zero VU
___ 36 Set the Line Meter to +10
___ 37 Set the signal generator modulation on
___ 38 The Line Meter should read above 0 VU (10 mw)
___ 39 Set the Line Gain off max until the Line Meter reads 0 VU (10 mw)
___ 40 Set the signal generator modulation off
___ 41 Set the Meter Switch to -10
___ 42 Observe 30 db change (20 db on switch plus 10 db on meter scale)
_{--} 43 The Line Meter should read less than -10 VU (SN + N > 30 DB)
___ 44 Set the Line Meter to OFF
\_\_ 45 Set the Line Gain to 0
```

K. Alternate Procedure To Set The IF Gain Control

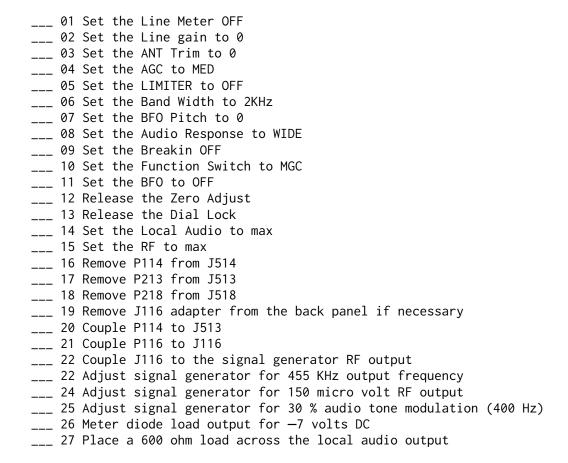

Once the receiver has been fully mechanically and electrically aligned, the final procedure to perform before "buttoning it up" is to set the IF gain control. The manual specification to set the IF Gain control for a level of -7 volts on the diode load for 150uv @455kc into J-513 is far too hot. Many otherwise very sensitive R390A's are thought not be hearing weak signals, because these signals are covered by excess noise generated in the IF module. The most common single item responsible for holding an R390A back is not lack of sensitivity. Rather it is internally generated IF deck noise.

	01	Allow the receiver to warm up for at least 1 hour then:
		Terminate the antenna input (just ground the balanced inputs)
		Set receiver for 15.2 MHz (Selected point of mechanical alignment)
		Set the "FUNCTION" switch to MGC
		Select the 4kc filter with the "BANDWIDTH"
		Set "RF GAIN" control to 10 or maximum
		Peak the "ANTENNA TRIM" for maximum noise
		Use the "LINE LEVEL" meter for peaking noise
		Set "Line Meter" switch to -10db scale
		Set "Line Gain" control to full CW or "10."
	11	Adjust IF gain control, R-519 to between -4 to -7 VU on Line Meter
		Set the "FUNCTION" switch to AGC
	13	Re-zero the carrier meter control, R-523
	14	Set controls above for normal operation
	15	Remove antenna short and reinstall antenna
	16	Power up the oven and verify function of the thermostat
	17	Turn the oven off
	18	Leave receiver on for at least 14 days to reform caps
LΙ	F M	odule Alignment
	01	Continue with the prior setup
	01 02	Continue with the prior setup Adjust signal generator for 455 KHz output frequency
 	01 02 03	Continue with the prior setup Adjust signal generator for 455 KHz output frequency Adjust signal generator for 150 micro volt RF output

Q IF And Audio Module Tube Optimizing

Optimizing the vacuum tube lineup in the signal path is another technique to maximize performance. Start with the tubes in the IF strip. These are the 5749W's IF amps, V-501, V-502 and V-503. The 6AK6 4th IF amp V-504 and the detector, V-506, a 5814A. Continue with the Audio module tubes. Then do the RF module tubes last. The tubes can be optimized before any alignment is conducted. But the usual procedure is to do a signal alignment, conduct the tube optimization and then do another complete signal alignment. Normal procedure is to conduct the signal alignment and tube optimization together in module by module stages IF and Audio modules, then RF and oscillator modules. Watch the noise level of each tube with the modulation off. The meter should lie quietly. If the meter needle is bouncing then consider this as additional noise from the tube. It may take several passes in a poor receiver to grade other noisy tubes out of the receiver and reach acceptable levels of performance. Use the best tubes on hand and place them in the optimum performance order. New tubes may not be better than existing tubes. When new tubes are received, grade them against all like tubes on hand. Keep track of the spares and their values. If the signal to noise ratios are good some meter bounce is expected. If you reach the point where you believe you have good tubes through the receiver and the meter just will not lie quietly, then you have to start looking for, leaky caps, poor resistors, bad solder joints, dirty tube sockets, dirty connector pins, loose or corroded tie lugs.

	Meter local audio output for 450 milliwatts, 27 db, or 17.3 Volts AC
	In pass one gather all the spare 5749's
 30	Pull the BFO and VFO 5759 tubes (V505, V701)
	Pull the AGC IF AMP (V508)
	Remember the goal is best signal to noise ratio or each tube
 33	Set the signal generator modulation on and record the audio output
 34	Set the signal generator modulation off and record the audio output
 35	The difference in these two values is the merit of the tube in V501
 36	Place each spare 5759 into V501 to find a merit value for the tube
 37	Grade the spare 5749's from worse to best
 38	Place the worse tube in V503
 39	Place the second poorest tube in V502
 40	Start over and re-grade the 5749's in V501 (32, 33, 34)
	Select the very best signal to noise 5749 for the V701 (VFO)
	Place the second best 5749 in V501
	Place the third best 5749 in V502
	Place the fourth best 5749 in V503
	Place the fifth best 5749 in V505 (BFO)
	Place the sixth best 5749 in V508 (AGC IF AMP)
	In pass two gather all the spare 6AK6's
	Remove V604 Line Audio
	Set the signal generator modulation on and record the audio output
 50	Set the signal generator modulation off and record the audio output
 51	The difference in these two values is the merit of the tube in V504
	Place each spare 6AK6 into V504 to find a merit value for the tube
	Place the worse tube in V603 Local Audio
	Start over and re-grade the 6AK6's in V504 (49, 50, 51)
	Place the best 6AK6 in V504 (4 th IF Stage)
	Place the second best 6AK6 in V603 Local Audio
	Place the third best 6AK6 in V604 Line Audio
	In pass three gather all the spare 5814's
	Remove V507, V509, V205, V206
	Set the signal generator modulation on and record the audio output
 61	Set the signal generator modulation off and record the audio output
	The difference in these two values is the merit of the tube in V601
	Place each spare 5814 into V601 to find a merit value for the tube
	Place the worse tube in V602
	Place the second worse tube in V506
	Start over and re-grade the 5814's in V601 (60, 61, 62)
	Place the best 5814 in V506 Detector
	Place the 2 nd best 5814 in V601 1 st AF AMP and Follower
	Place the 3 rd best 5814 in V602 Local AF AMP
	Place the 4 th best 5814 in V507 Limiter
	Place the 5 th best 5814 in V205 Calibration Oscillator
	Place the 6 th best 5814 in V206 100 KC Multivibrator
	Place the 7 th best 5814 in V509 AGC Rectifier
	Adjust signal generator for 455 KHz output frequency
	Adjust signal generator for 150 micro volt RF output
	Adjust signal generator for 30 % audio tone modulation (400 Hz)
	Meter diode load output for -7 volts DC Set the Band Width to 2 KHz
 10	SEL THE DAMA MIATH TO 5 KHZ

_	$_{}$ 79 Adjust the IF gain R519 for $-$ 7 V DC on the diode load
_	80 Meter local audio output for 450 milliwatts, 27 db, or 17.3 Volts AC
_	81 Set the signal generator modulation on and record the audio output
_	82 Set the signal generator modulation off and record the audio output
_	83 Meter local audio output for 1 milliwatt, 0 db, or .775 Volts AC
_	84 If the difference must be greater than 27 db. (30 likely)
_	85 Remove all test equipment
	86 Return the receiver connections to their original configurations

R. Adjust T208, C520, L503, and Zero BFO

```
___ 01 Set the Line Meter OFF
___ 02 Set the Line gain to 0
___ 03 Set the ANT Trim to 0
___ 04 Set the AGC to MED
___ 05 Set the LIMITER to OFF
___ 06 Set the Band Width to 2KHz
___ 07 Set the BFO Pitch to 0
___ 08 Set the Audio Response to wide
___ 09 Set the Breakin OFF
___ 10 Set the Function to MGC
___ 11 Set the BFO OFF
___ 12 Release the Zero Adjust
___ 13 Release the Dial Lock
___ 14 Set the Local Audio to max
___ 15 Set the RF to max
___ 16 Adjust signal generator for 455 KHz output frequency
___ 17 Adjust signal generator for 75 micro volt RF output
___ 18 Adjust signal generator for 30 % audio tone modulation (400 Hz)
___ 19 Meter diode load output for -7 volts DC
___ 20 Place a 600 ohm load across the local audio output
___ 21 Meter local audio output for 450 milliwatts, 27 db, or 17.3 Volts AC
___ 22 Connect the signal generator to E211 through a capacitor.
___ 23 Adjust signal generator for diode load output of -7 volts DC
___ 24 Adjust T208 for peak (This adjustment is broad)
___ 25 Adjust signal generator for diode load output of -7 volts DC
___ 26 The signal level should be less than 75 micro volt RF output (50)
___ 27 The signal with 30% modulation should output 450 milliwatts audio
___ 28 Set the signal generator modulation on and record the audio output
___ 29 Meter local audio output for 450 milliwatts 27 db,or more
___ 30 Set the signal generator modulation off and record the audio output
___ 31 Meter local audio output for 1 milliwatt, 0 db, or less
___ 32 Set the Band Width to .1 KHz
___ 33 Rock the signal generator for maximum diode load output
___ 34 Adjust signal generator for diode load output of -7 volts DC
___ 35 Record the signal generator output level
___ 36 The following steps should produce six marks around C520
___ 37 Switch the generator output up 60 db (two switch steps on URM 25)
_{--} 38 Increase the generator frequency until output drops to -7 volts DC
___ 39 Adjust C520 for a dip in the diode load voltage
___ 40 Mark the can and label this H (5 o'clock)
___ 41 Adjust C520 for the other side dip in the diode load voltage
___ 42 Mark the can and label this H (7 o'clock)
___ 43 Decrease the generator frequency until output drops to -7 volts DC
___ 44 Adjust C520 for a dip in the diode load voltage
___ 45 Mark the can and label this L (4 o'clock)
___ 46 Adjust C520 for the other side dip in the diode load voltage
___ 47 Mark the can and label this L (8 o'clock)
___ 48 Divide each pair of dips and mark the can C
___ 49 Set C520 to the C mark (either 4:30 or 7:30)
```

 50	Rock the signal generator (to 455) for maximum diode load output
 51	Adjust signal generator for diode load output of -7 volts DC
 52	Set the Band Width to 1 KHz
 53	Adjust L503 for peak output
 54	Set the BFO switch ON
 55	Loosen the clamp on the BFO shaft extension
 56	Zero the BFO knob
 57	Zero the BFO against the signal
 55	Tighen the clamp on the BFO shaft extension
 56	Set the BFO switch OFF
 57	Disconnect the generator

S 2nd Crystal Oscillator Alignment

When adjusting the 2^{nd} Crystal Oscillator you can hear the noise peak better than you can measure it with the meter. Peak the caps up with both the meter and head phones.

 01	Meter the local audio output across a 600 Ohm load
 02	Meter the diode load for − 7 volts DC
 03	Use a good set of head phones to monitor the audio output
 04	Set the function switch to CAL
 05	Set the BFO OFF
 06	Set the KHz to 500
 07	Set the KHz to 31
 80	Set the Bandwidth to 2 KHz
 09	Rock the KHz to produce maximum indication on the diode load
 10	Set the Local Output meter range to provide a mid scale reading
 11	Use the head phones to hear the noise peak as you make adjustments
 12	Screw the slug of T401 out until only one peak can be obtained
	while turning trimmer capacitor 31 through its entire range.
 13	Set trimmer capacitor slightly away from peak
 14	Adjust the slug in T401 for peak output
 15	Readjust capacitor 31 and ensure it has two peaks.
 16	Adjust capacitor 31 to peak (watch the meters for best indication)
 17	Move the MHz down one detent (you can hear the noise peak)
 18	Adjust the corresponding capacitor to peak
 19	Stop at 8MHz

T 1st Crystal Oscillator Alignment

___ 01 Meter the local audio output across a 600 Ohm load $_{--}$ 02 Meter the diode load for - 7 volts DC ___ 03 Use a good set of head phones to monitor the audio output ___ 04 Set the function switch to CAL ___ 05 Set the BFO OFF ___ 06 Set the KHz to 500 ___ 07 Set the MHz to 7 ___ 08 Set the Bandwidth to 2 KHz ___ 09 Rock the KHz to produce maximum indication on the diode load ___ 10 Adjust the slug in T207 for peak output

U VFO Band Spread Test

- ___ 01 Set the Line Meter OFF ___ 02 Set the Line gain to 0
- ___ 03 Set the ANT Trim to 0
- ___ 04 Set the AGC to MED
- ___ 05 Set the LIMITER to OFF
- ___ 06 Set the Band Width to 2KHz
- ___ 07 Set the BFO Pitch to 0
- ___ 08 Set the Audio Response to wide
- ___ 09 Set the Breakin to OFF
- ___ 10 Set the Function to CAL
- ___ 11 Set the BFO to ON
- ___ 12 Set the Zero Adjust to center
- ___ 13 Release the Dial Lock
- ___ 14 Set the Local Audio to max
- ___ 15 Set the RF to max
- ___ 16 Set the KHz knob to -000
- ___ 17 Adjust the BFO Pitch to zero beat
- ___ 18 Set the KHz knob to +000
- ___ 19 Rock the KHz knob to zero beat
- ___ 20 The VFO band spread should be less than 300 Hertz

v v	EΛ	Pand Spread Adjustment
		Band Spread Adjustment
		If needed continue from the preceding section
		Set the FUNCTION switch to CAL
		Set the MHz to 9 MHz
		Set the Zero Adjust to center
	05	Set the KHz knob to 000
	06	Remove the Oldham coupler spring
	07	Remove the VFO from the receive
		Remove the end point adjustment cap screw
		Attach the output cable and harness cable
		Adjust the VFO shaft for a zero beat
		Mark the coupler and VFO face (9,000 3,455)
		Set the KHz knob for 9,+000 (9,+000 2,455)
		Dial 10 turns on the VFO shaft and align the marks
		If the span is not exact make a small adjustment to the end point
		Do not over adjust the end point to a complete zero beat
		Observe the pitch is closer to zero beat
		Back off the 10 turns on the VFO shaft (only work one way)
		Set the KHz knob to 000
		Adjust the VFO shaft for a zero beat
		Mark the coupler and VFO face (9,000 3,455)
		Set the KHz knob for 9,+000 (9,+000 2,455)
		Dial 10 turns on the VFO shaft and align the marks
	23	If the span is not exact make a small adjustment to the end point
	24	Do not over adjust the end point to a complete zero beat
	25	Observe the pitch is closer to zero beat
	26	Repeat steps 17, 18, 19, 20, 21,22, 23, 24 and 25 until span is exact
		Make a small adjustment to the end point (CW longer CCW shorter
		Do not over adjust the end point to a complete zero beat
		replace the end point cover screw
		Return the VFO shaft to its original location
		Reinstall the VFO into the receiver
		Carefully verify the 10 turn operation of the VFO
	33	Adjust the mechanical position of module for best shaft alignment
	34	Adjust the Oldham coupler for a free spacing of shafts
		Replace the Oldham coupler spring
		Attach an antenna to the balanced input
		Tune WWV at 20MHz, 15Mhz, 10MHz or 5Mhz
		Set the BFO to OFF
		Set the bandwidth to .1Khz
		Set the KHz to 000
		Loosen the front KHz shaft clamp on the Oldham coupler
		Rock the VFO to peak WWV through the crystal filter
		Tighten the front KHz shaft clamp on the Oldham coupler Set the BFO to ON
		Set the BFO Pitch to 0
		Loosen the extension shaft clamp on the BFO
		Adjust the BFO shaft to zero the BFO Pitch
		Tighten the extension shaft clamp on the BFO
		Set the FUNCTION Switch to CAL
	50	Adjust the CAL Adjust Trim to zero the Calibration Oscillator

W. RF Alignment

 01 Install a 600 ohm resistor on the line level output.
02 Place a meter and 600 ohm load on the Local Audio output TS 585
 03 Connect the generator to the receiver's balanced antenna input
 04 Place a DC meter on the diode load
05 Turn the receiver on and allow it to warm up for 1 hour
06 Turn the signal generator on and allow it to warm up for 1 hour
07 Set the R390 or R390A Function switch to "MGC
08 Set the R390 or R390A Bandwidth to 2kc
09 Set the R390 or R390A RF gain full CW (Clock Wise)
10 Set the R390 or R390A AF line gain full CW
11 Set the Line Meter range switch to + 10
12 Set the R390 or R390A AF local gain full CW
13 Set the R390 or R390A BFO off
14 Set the Audio response to wide
15 Set the Limiter to off
 16 Set the receiver and generator to the same frequency of choice
 17 Rock the generator for a peak in to the band pass
 18 Set the initial generator output to 10uv
 19 Set the generator modulation level to at 30% 400 Hz or 1 KHz
 20 Use the Ant Trim to peak the receiver
 21 Reduce the signal generator RF output for -7 volts DC
22 Use 550 for L213, L224-1,, L224-2 Slugs 1 st Octave
23 Use 950 for C201-B, C230-1, C230-2 Caps 1 st Octave
24 Use 1,100 for L215-1, L215-2, L215-3 Slugs 2 nd Octave
25 Use 1,100 for C291-1, C291-2, C291-3 Caps 2 nd Variable IF
26 Use 1,250 for L232-1, L232-2, L232-3 Slugs 1 st Variable IF
27 Use 1,900 for L233-1, L233-2, L233-3 Slugs 2 nd Variable IF
28 Use 1,900 for C205-B, C233-1, C233-2 Caps 2 nd Octave
29 Use 2,250 for L217, L226-1, L226-3 Slugs 3 rd Octave
30 Use 3,800 for C209B, C236-1, C26-2 Caps 3 rd Octave
31 Use 4,400 for L219, L227-1, L227-2 Slugs 4 th Octave
32 Use 7,250 for C283-1, C283-2, C283-3 Caps 1 st Variable IF
33 Use 7,600 for C213B, C239-1, C239-2 Caps 4 th Octave
34 Use 8,800 for L221, L227-1, L227-2 Slugs 5 th Octave
35 Use 15,200 for C217B, C242-1, C242-2 Caps 5 th Octave
 36 Use 17,600 for L223, L229-1, L229-2 Slugs 6 th Octave
 37 Use 30,400 for C221B, C241-1, C241-2 Caps 6 th Octave
20.01 27.00 (17.1/1/1/10) 11.1/1/11
38 Observe 27 DB (17 Volts AC) on the Local Audio
39 This should also be 450 milliwatts on the Local Audio
40 Observe + 10 on the Line Meter (0 VU + 10 switch)
 41 Set the signal generator to CW
 42 The Meter on the Local Level should drop 20 DB 43 The Line Meter should drop 20 DB
 44 The signal generator RF level should be less than 3 micro volts 45 Record the frequency and the output of the generator in micro volts
46 This value is the 20 DB S/N + N receiver level at this frequency
 47 This is the relative receiver noise floor level at this frequency

X RF Deck Tube Optimization

In the RF deck we want to check the 6DC6 $1^{\rm st}$ RF, 6C4's Mixers, and 5654's Crystal oscillators. Use a frequency above 8 MHz to take the third conversion out of the process.

	Install a 600 ohm resistor on the line level output.
 02	Place a meter and 600 ohm load on the Local Audio output TS 585
	Connect the generator to the receiver's balanced antenna input
 04	Place a DC meter on the diode load
 05	Turn the receiver on and allow it to warm up for 1 hour
 06	Turn the signal generator on and allow it to warm up for 1 hour
	Set the R390 or R390A Function switch to "MGC
	Set the R390 or R390A Bandwidth to 2kc
	Set the R390 or R390A RF gain full CW (Clock Wise)
	Set the R390 or R390A AF line gain full CW
	Set the Line Meter range switch to + 10
	Set the R390 or R390A AF local gain full CW
	Set the R390 or R390A BFO off
	Set the Audio response to wide
	Set the Limiter to off
	Set the receiver and generator to the same frequency of choice
	Rock the generator for a peak in to the band pass
	Set the initial generator output to 10uv
 19	Set the generator modulation level to at 30% 400 Hz or 1 KHz
 20	Use the Ant Trim to peak the receiver
 21	Reduce the signal generator RF output for -7 volts DC
 22	Observe the power level on the Local Audio meter.
	Set the generator to CW
	Observe the power level on the Local Audio meter
	You expect a 20 DB drop in output on the Local Audio meter
	Swap all your 6DC6 tubes into the 1st RF.
	Measure the relative difference of each tube (step $20 - 25$)
	Select the 6DC6 with the largest difference of signal to noise
	This tube may not be the one with the largest gain
	Swap all your 6C4 tubes into V203 2 nd Mixer
	Measure the relative difference of each tube (step $20 - 25$)
	Select the 6C4 with the largest difference of signal to noise
	Place the best 6C4 in the 1 st Mixer
	Place the best 6C4 in the 2 nd Mixer
	Place the best 6C4 in the 3 rd Mixer
	Swap all your 5654 6AK5 tubes into V401 2 nd Crystal Oscillator
	Measure the relative difference of each tube (step 20 - 25)
	Place the best 5654 in the 1 st Crystal Oscillator
	Place the best 5654 in the 2 nd Crystal Oscillator
 40	Grade all the spare tubes for future use

Older used tubes will often have a better signal to noise span than new tubes. So some day you have to put the new tubes into the receiver and start aging them so they can get quiet. A new 6CD6 is what it is, Your stuck with it as the best you have. You can put new 5654's 2^{nd} Crystal Oscillator and 6C4's into

the 3rd mixer. It gets them futher down the amplifier chain and thus their higher noise level is masked by other stages. You may know a tube is not as good as another tube, but when used in the later stages you may not be able to measure the difference of the tubes when swapping them into the later stages.

Y. Receiver Sensitivity Test

There may be an occasion when its appropriate to measure and record receiver sensitivity in real terms using an accepted standard. For radio receivers, real term sensitivity is expressed as the value of a modulated RF voltage applied to the antenna input necessary to provide a 10db S/N + N figure. This means, what input voltage is required to raise audio output 10 db over the receiver noise floor. Some prefer to do the test with a band width of 2 Khz. Others prefer to do the test at 4 or 8 Khz. If you are comparing the R390 to another receiver you would like to use the same band width. At 2 Khz you expect the receiver to have a 20db S/N + N figure. This test is preferred as a minimum signal test. How small of a signal on the antenna can still be copied? An alternative test is, for a fixed signal level, how far is it above the noise floor. We see this in the If deck where we expect 150 micro volts to provide 30 DB of signal above the noise floor. In the RF deck or end to end test we expect 3 micro volts to provide 20 DB of signal above the noise floor. Measuring the receiver sensitivity in the R390A is an easy, straight forward procedure. The receiver Line Level meter can even be used to help with the measurement.

Here is the procedure for sensitivity:

 01	Turn the receiver and allow it to warm up for 1 hour
 02	Turn the signal generator and allow it to warm up for 1 hour
	Set the receiver and generator to the same frequency of choice
	Adjust the Kilocycle Change to peak the generator in the band pass
	Set the initial generator output to 1uv
	Set the initial generator modulation level to 400 Hz or 1kc at 30%
	Set the R390 or R390A Function switch to "MGC
	Set the R390 or R390A Bandwidth to 4kc
	Set the R390 or R390A RF gain full CW (Clock Wise)
	Set the R390 or R390A AF line gain full CW
 11	Set the R390 or R390A AF local gain full CW
	Set the R390 or R390A BFO off
 13	Disconnect the signal generator from the receiver
 14	Set the Line Meter range switch to -10
 15	Adjust the Line Gain for a -10db indication on the Line Level meter
 16	Use the Ant Trim to peak the receiver noise alone
 16	Readjust the Line Gain for a -10db on the Line Level meter
 17	This is the relative receiver noise floor level
 18	Connect the generator to the receiver's balanced antenna input
 19	Reduce the RF output level of the generator.
 20	For a R390 Line Level meter value of 0
 21	Record the frequency and the output of the generator in micro volts
 22	This value is the 10db S/N + N receiver sensitivity at this frequency
 23	It should be less than .5uv
	The official specifications of the receiver call for 3 micro volts
 25	Work alone the range of the VFO and conduct this test at each MHz
	.900, 1,900, 2,800, 3,700, 4,600, 5,500, 6,400, 7,300
	8,200, 9,100, 10,000
 28	To get a value for each Mhz crystal and the range of the VFO.

___ 29 Check the SN + N at the alignment points
___ 30 550, 950, 1,100, 1,250, 1,900, 2,200, 3,800, 4,400,
__ 31 7,250, 7,600, 8,800, 15,200, 17,600 30,400

Z. Receiver Signal to Noise Test

 01	Install a 600 ohm resistor on the line level output.
 02	Turn the receiver on and allow it to warm up for 1 hour
 03	Turn the signal generator on and allow it to warm up for 1 hour
 04	Set the R390 or R390A Function switch to "MGC
 05	Set the R390 or R390A Bandwidth to 2kc
 06	Set the R390 or R390A RF gain full CW (Clock Wise)
	Set the R390 or R390A AF line gain full CW
	Set the R390 or R390A AF local gain full CW
	Set the R390 or R390A BFO off
	Connect the generator to the receiver's balanced antenna input
	Place a meter and 600 ohm load on the Local Audio output.
	Set the receiver and generator to the same frequency of choice
	Use the RF deck alignment point frequencies
	Conduct the test while performing RF deck alignments
	Use 550, 950, 1,100, 1,200, 1,900, 2,250, 3,800, 4,400,
	Use 7,250, 7,600, 8,800, 15,200, 17,600 30,400
	Rock the generator for a peak in to the band pass
	Set the initial generator output to 10uv
	Set the generator modulation level to at 30% 400 Hz or 1 KHz
	Use the Ant Trim to peak the receiver
	Set the Line Meter range switch to + 10
	Reduce the RF output level of the generator to 0 VU
	This should also be 450 milliwatts on the Local Audio
	This value is the 20 DB S/N + N receiver level at this frequency
 25	Set the signal generator to CW
 26	The Meter on the Local Level should drop 20 DB
 27	The Line Meter should drop to -20 DB
	This is the relative receiver noise floor level at this frequency
	It signal generator RF level should be less than 3 micro volts
	The official specifications of the receiver call for 3 micro volts
	Record the frequency and the output of the generator in micro volts

@ Use the following to check set the first trimmer cap in the RF cans

 01	Install a 600 ohm resistor on the line level output.
 02	Place a meter and 600 ohm load on the Local Audio output (TS 585)
 03	Use two 68 ohm resistors between the generator and the receiver
 04	Insert one resistor lead into each of the balanced antenna inputs
	Place the resistors in parallel
 06	Place a DC meter on the diode load (- 7 volts DC)
 07	Turn the receiver on and allow it to warm up for 1 hour
 08	Turn the signal generator on and allow it to warm up for 1 hour
 09	Set the R390 or R390A Function switch to "MGC
	Set the R390 or R390A Bandwidth to 2kc
 11	Set the R390 or R390A RF gain full CW (Clock Wise)
 12	Set the R390 or R390A AF line gain full CW
 13	Set the Line Meter range switch to + 10
 14	Set the R390 or R390A AF local gain full CW
 15	Set the R390 or R390A BFO off
	Set the Audio response to wide
 17	Set the Limiter to off
	Set the receiver and generator to the same frequency of choice
	Set the initial generator output to 100uv (or more)
	Set the initial generator modulation level to 400 Hz or 1KHz at 30%
	Rock the generator for a peak in to the band pass
	Reduce the generator output for a diode load value of -5 volts
	Use 750, 1,500, 3,000, 6,000 12,000, 24,000 Mhz
	Use 750 for C201-A, Cap 1 st Octave
	Use 1,500 for C205-A, Cap 2 nd Octave
	Use 3,000 for C209-A, Cap 3 rd Octave
	Use 6,000 for C213-A, Cap 4 th Octave
	Use 12,000 for C217-A, Cap 5 th Octave
	Use 24,000 for C221-A, Cap 6 th Octave
 30	Ignore the TM and adjust each cap for maximum output
